AI Usage and Impact on Students and Professionals

Research summary

Student make up 52.4% of records with a reported user type. The groups are represented at similar rates.

Coding is the most common reported AI purpose (65 responses; 23.6% of non-missing responses).

Daily AI use has a median of 2.0 hours (281 complete responses).

No selected student–professional outcome comparison remained statistically significant after adjustment; this does not prove the groups are equivalent.

Daily AI-use hours and reported weekly time saved are associated (Spearman ρ=0.82, n=271); this association does not establish causation.

Age has the most missing data (8.0%).

Limitations

The sampling method and dataset provenance are unknown. Responses are self-reported, missing data was not imputed, and associations do not demonstrate causation.
